

1. Project Title

Library Management System

2. Project Description

The proposed **Library Management System** is a system developed to manage the daily activities of a physical library.

The system will help the librarian manage book records, student/member records, and book issuing and returning activities.

The purpose of this system is to reduce manual record keeping and make it easier for the librarian to maintain and access library information.

3. Problem Statement

Managing a physical library using manual records can be time-consuming and may lead to errors or loss of information.

It can also be difficult to identify the availability of books and keep track of which students have borrowed books.

Therefore, this project proposes a web-based system to organize library records and simplify the management of books, students, issuing, and returning activities.

4. Project Objectives

- To develop a web-based system for managing a physical library.
- To manage book information efficiently.
- To manage student/member information.
- To record book issuing and returning activities.
- To track the availability of books.
- To reduce manual record keeping.
- To improve the accuracy and efficiency of library management.

5. Target Users

- **Librarian**

6. Main System Features

- **Admin Login** – Allow the librarian/admin to securely access the system.
- **Dashboard** – Display total books, students, issued books, returned books, and available books.
- **Book Management** – Add, view, search, edit, and delete book records.
- **Student Management** – Add, view, search, edit, and delete student/member records.
- **Issue Book** – Record books issued to students and their issue/due dates.
- **Return Book** – Record returned books and update their availability.
- **Reports** – View basic information about books, students, issued books, and returned books.

7. Proposed Technology Stack

Frontend: HTML, CSS

Backend: PHP

Database: MySQL

Development Environment: XAMPP

8. Expected Outcome

At the end of the project, a functional **Library Management System** will be developed for managing a physical library.

The system will allow the librarian to manage books and student records and efficiently handle book issuing and returning.

The system is expected to reduce manual paperwork, improve record accuracy, and make library information easier to manage and access.
